Executive Summary

Wespine Industries Pty Ltd (Wespine) produces Softwood woodchips for export. Occasionally, woodchips from certain hardwood species are produced and sold for paper manufacturing or renewable energy generation.

Wespine source’s predominantly Pinus radiata from Western Australia including all sub districts within these state boundaries.

Suppliers are public forests and private wood lots supplying Controlled Material included in Wespine’s own FSC Controlled Wood Due Diligence System.

For all suppliers including third party private growers, detailed records are kept of supplying blocks and these are made available to FSC auditors as part of the Wespine FSC/PEFC Chain of custody system.

This document outlines the Due Diligence Systems (DDS) system under FSC-STD-40-005 (V3.1) REQUIREMENTS FOR SOURCING FSC® CONTROLLED WOOD - PART I DUE DILIGENCE SYSTEM.

The basis of the Wespine Due diligence system is three elements: obtaining information, risk assessment, risk mitigation.

*Wespine concludes that there is a strong system of control for wood that it procures.*

Table 1 - Suppliers to Wespine Industries can be found at FSC CoC-01-01 – List of FMUs and Suppliers.xlsx
1. Introduction

Wespine has controlled wood supply for their products from local controlled material sources. Local supply is from the following suppliers listed in Table 1 - Suppliers to Wespine Industries.

FSC Australia has conducted a National Risk Assessment FSC-NRA-AU V1-1. Wespine has relied upon this risk assessment and developed a verification program for controlled wood sources under FSC-STD-40-005.

The National Risk Assessment found an unspecified risk for Controlled Wood Category Three – High Conservation Values (HCV).

The risk assessment also found an unspecified risk for Controlled Wood Category Four – Wood from forests being converted to plantations or non-forest use. Indicator 4.1 - Conversion

2. Due Diligence System

This document outlines the Due Diligence (DD) system under FSC-STD-40-005 (V3.1) REQUIREMENTS FOR SOURCING FSC® CONTROLLED WOOD - PART I DUE DILIGENCE SYSTEM.

The basis of the Wespine Due Diligence System is three elements: obtaining information, risk assessment, and risk mitigation.

**Obtaining information.**

Wespine uses a risk assessment on their supply chain as part of their program for controlled wood sources under FSC-STD-40-005 (V3.1). REQUIREMENTS FOR SOURCING FSC® CONTROLLED WOOD. The risk assessment used is the National Risk Assessment for Australia "(FSC-NRA-AU V1-1)" which are can be accessed at https://fsc.org/en/document-center/documents/395.

This National Risk Assessment has already obtained information and formulated a risk assessment and has determined a low risk for three of the five controlled wood criteria in Western Australia.

Two categories of risk were found to be unspecified, being CW Category 3 – High Conservation Values, and CW Category 4 – Wood from forests being converted to plantations or non-forest use.

The objective of the control measures is to ensure that:

1. there is a strong system of protection (effective protected areas and legislation) in place that ensures survival of the HCVs in the ecoregion, satisfying Controlled Wood Category Three.

2. The risks of sourcing material from forests where conversion is occurring, or has occurred since 1996 are nullified. This satisfies Controlled Wood Category Four.

Therefore, risk mitigation is achieved by applying the guidance as control measures and monitoring the effectiveness of their implementation.

Wespine also documents the risk of mixing material with non-eligible inputs in its supply chains during transport, processing, or storage. Refer to 3. Mixing Risk Assessment

1.1 to 1.9  

Document FSC-NRA-AU V1-1 found that “there is no conversion of Native forest in WA to plantations. All native forest harvested is regenerated.”

“Commonwealth data shows that WA lost 119 230 ha of forest between 2010 and 2014. That is 23 846 ha/year. There is 19 192 000 ha of forests in WA at the moment. Thus 0.12% is lost/year.

None of this loss can be attributed to native forest harvesting, instead it is attributable primarily to agriculture and mining to a lesser extent. The trend over the years is decreasing, thus that is good news.”

**SUMMARY:**

Suppliers to Wespine Industries Pty. Ltd.

Suppliers are listed in the document management system.
4. Risk Mitigation - Basis of the Control Measures and Monitoring of the Control Measures

The basis of the control measures are:

1. Review of controls in place for Category Three – HCV and Category Four – Conversion. The suppliers are all contracted for supply of logs and/or chips. Harvest contractors are contracted for harvesting of trees. As part of an annual supplier approval process Wespine will review suppliers for compliance to certain contract requirements. This includes things like OHS, business insurance but now also includes a review of their control of HCV measured against the FSC Australia HCV evaluation framework.
2. For private suppliers Wespine will carry out some of the control measures themselves to assist with preparing harvest plans, or will utilise forest managers to assist.
3. Ongoing monitoring of the control measures. Wespine will monitor and verify that the control measures are undertaken in harvest planning and harvest operations. Wespine will regularly visit harvest operations and will monitor the control measures during those visits e.g. checking harvest records, harvest QA records, and CoC & FSC CoC-07-01 Forest Operation Inspection

A record of these visits and the checks made will be kept by Wespine as evidence of these control measures.

5. Assessment of Control Measures

5.1. Forest Products Commission

General

The controlled materials are sourced predominantly from public land vested in the Department of Biodiversity, Conservation and Attractions (DBCA) and some privately owned land (Sharefarms). The common thread is that the harvest is managed by the Forestry Products Commission (FPC).

The overall strategy for harvesting the WA State Government owned plantation estate is set within the Forest Management Plan. The forest management plan covers lands vested in the Conservation and Parks Commission within the State's south-west forests. The focus of forest management plans is on managing State forest and timber reserves because it is primarily on these land categories that disturbance activities are permitted.

The forest management plan is a 10-year plan developed in consultation with the community. It is the key policy framework for managing forests as these plans identify goals and performance targets and propose management activities to achieve these goals.

The Forest management plan 2004-2013 was the first plan prepared since the management of forests was separated from commercial timber operations in 2000.

Under this plan old-growth forest was excluded from timber harvesting and the conservation reserve system was extended creating 29 national parks, conservation parks and nature reserves. Approximately 500,000 hectares was added to the conservation reserve system.

Covering 2.5 million hectares from Lancelin, north of Perth, to Denmark on the south coast, nearly 62 per cent of this total land area is in existing or proposed conservation reserves or otherwise protected areas. The plan aims to strike a balance between conservation and other activities. It incorporates a number of management activities to help conserve biological diversity, provide for recreation and a sustainable native forest products industry, and to protect water catchments.

Protected areas in Western Australia well exceed those minimum levels recommended in the Forest Management Plans. This level for most areas is 15% of the pre-1750 area. The chart Figure 2 below gives a breakdown by forest ecosystems.

This target was set during the negotiations towards the Western Australian Regional Forest Agreement (RFA)\(^1\). The WA RFA is a 20-year agreement between the State and Commonwealth governments on the use and management of the forests of Western Australia's south-west. The WA RFA was signed on 4 May 1999 and expires in 2019.

It meets the three main objectives of the RFA process:
- to protect environmental values in a world class system of national parks and other reserves, based on nationally agreed criteria;
- to encourage job creation and growth in forest-based industries, including wood products, tourism and minerals; and
- to manage all native forests in a sustainable way.

For the environment, it established a world class reserve system which is Comprehensive, Adequate and Representative (CAR) of the forests' biodiversity, old-growth forest, and other natural and cultural values. The Parties to the RFA agreed that CAR Reserve System would adequately provide for the protection of rare or threatened flora and fauna species. The Parties went on to acknowledge the CAR reserve system met the ‘JANIS’ Reserve Criteria.

![Percentage Reservation Levels of Forest Ecosystems](chart.png)

**Figure 2 - Reservation against CAR Target for Forest Ecosystems, Conservation Commission, Draft FMP 2014-2023, pg 33.**

For harvesting (a “disturbance activity”, which also includes roading, silviculture work) on DBCA vested land, DBCA prepare a Form DBCA 019 that covers:
- Tenure
- Biological Diversity
- Productive Capacity
- Health and Vitality
Operations on private land go through a similar process and produce an FPC47.

There is a 5-year strategic harvest plan for wood flows over those 5 years and Annually produced detailed harvest plans for cipuces to be harvested in that year. The harvest plans must be submitted for approval by DBCA for compliance to the Forest Management Plan.

The key aspects of the DBCA Disturbance Activity Statement (previously a DBCA019) and FPC47 (for Sharefarms and private property) that are within the control or influence of the FPC area officer in charge and the contractors reporting to the FPC are communicated at the commencement of an operation via an FPC377.

The 377 distils key operational controls, and includes maps showing rare threatened and endangered species in the locality, areas of significance for First Nations and water values that could be negatively affected by poor performance. It also includes details of stakeholders within the local area, and details what communication has been made to local residents (for example).

Once an operation has commenced, the day to day supervision of the performance against the 377 is monitored using a FPC106. This is now an electronic document, and automatically backs up to a central collector server, allowing full visibility that operational checks are being performed.

Further, it tracks escalations that occur when a transgression has been detected or observed. This escalated activity is known as an FPC080, and includes specific, time bound, follow up actions and inspections that must be closed out. Again, this is a visible process.

**Controlled Wood Category 3 – High Conservation Values**

**HCV 1.** Forest areas containing habitat for national or state-listed threatened species or species of high significance.

DBCA biodiversity overlays are used to identify and RTE species, if any are identified they are noted in the harvest plan, maps and the document that is given to contractors to operationalizes the plan (Form FPC 377) and DBCA provides a prescription as to their management and this is noted in the harvest plan. The presence of RTE values is also noted on maps that are contained in the harvest plans.

**HCV 2.** Forest areas containing large landscape level forests, contained within, or containing the management unit, where viable populations of most, if not all, naturally occurring species exist in natural patterns of distribution and abundance.

Not many areas under harvest are in large landscape level forests. Others however do have areas of significance\(^2\)

---

\(^2\) The forest is significant in the region due to its size, condition, and/or importance to biodiversity conservation. Factors to consider include:
Rarity of forests of this size and quality within the region. (FSC Australia)
Those areas with landscapes intact are known and have assessments done on them. Harvest plans will consider impacts on these values on a coupe by coupe basis and mitigate them. Plans are approved by DBCA.

**HCV 3 Forest areas that are in or contain rare, threatened or endangered ecosystems.**

DBCA biodiversity overlays are used to identify and RTE ecosystems e.g. Informal reserves, Conservation reserves, Informal habitat zones, Threatened communities, RAMSAR sites. If any are identified they are noted in the harvest plan and DBCA provides a prescription as to their management and this is noted in the harvest plan. The presence of RTE ecosystem values is also noted on maps that are continued in the harvest plans. There is a mechanism to feed back to DBCA in the event that new values are noted that are not on the overlays and maps managed by DBCA.

**HCV 4. Forest areas that provide basic services of nature in critical situations such as slope, erosion control, water catchment.**

The Code of Practice meets the requirements of HVC 4.

The FPC Timber Harvest Manual is based on the CoP and is followed.

Values are identified before harvest and incorporated into the harvest plan. In particular, where the coup is in an irrigation or drinking water catchment specific requirements are followed. For country or metro water supply catchments approvals by the water authorities is required under legislation.

Pre operations planning (FPC47 and DBCA019) and checklists used during harvest include elements contained in the Code of Practice. These are collated and signed off as part of the documentation recording compliance in a harvesting coup.

In 2013 there was the introduction of a new soils assessment procedure. Since then, an online induction tool for all forest contractors has been compulsory. This covers aspects such as soil movement, water conservation, and maintaining the productive capacity of the forest.

**HCV 5. Forest areas fundamental to meeting basic needs of local communities (water, food, firewood, shelter, income) with no readily available alternative.**

NOTE: These are not applicable in this situation e.g. no one relies on these forests for firewood or shelter.

---

3 eg Regional surveys: vegetation communities, condition assessment, wilderness assessment, concentrations of species, old growth, wilderness, growth stage, vegetation condition and remnant vegetation, logging history (FSC Australia)

4 Identification and mapping of HCV value areas pre harvest. Expert elicitation (documented in the code of practice) Code of practice which is followed. (FSC Australia)

5 Local people use the area to obtain resources on which they are critically dependent. (FSC Australia).
HCV 6. Forest areas critical to local communities’ traditional cultural identity (areas of cultural, ecological, economic or religious significance identified in cooperation with such local communities)

DBCA use publicly available information to identify and heritage sites on their land. If any are identified they are noted in the harvest plan and DBCA provides a prescription as to their management and this is noted in the harvest plan. There is also consultation with the Department of Indigenous Affairs (DIA) and the South West Land and Sea Council on the adequacy of these measures. The presence of Heritage values is also noted on maps that are continued in the harvest plans.

There is also cultural heritage training on observation and recognition of cultural heritage and dealing with cultural heritage issues is covered in the Timber harvesting manual.

If sites or artifacts are found during activities the appropriate authority (DIA) is alerted and their instructions followed. (Note this is mandatory in WA for Aboriginal sites). DIA are responsible for informing the South West land and Sea Council in such cases.

*Controlled Wood Category 4 – Wood from Forests being converted to plantations or non-forest use*

FPC has Responsible Wood Certification, which includes demonstrating evidence of no conversion after 1996.
5.2. Australian Forestry Services

General

The controlled materials are sourced from Pinus spp mainly P radiata from private plantations or farm forestry plantations grown in forest management lots up to 150 Ha.

If plantations have been established shire approval is needed for the establishment.

In the case of wood harvest on behalf of private growers there is a grower questionnaire that establishes to the best of the private grower’s knowledge about the presence of HCVs on their land.

Controlled Wood Category 3 – High Conservation Values

In addition publicly available information is interrogated to determine the presence or absence of HCV e.g. http://naturemap.dec.wa.gov.au/default.aspx

Any findings of HCV are recorded on maps and form part of the harvest plans.

HCV 1. Forest areas containing habitat for national or state-listed threatened species or species of high significance.

In general these are small plantations in and around farmed land with little or no native bush or habitat areas so the presence of Rare Threatened or Endangered (RTE) is unlikely. However there following steps are taken:

- The owner is asked if they know of any known sites with RTE species.
- Non planted areas are shown on a site map.
- Publically available maps and overlays are interrogated for the presence of RTE species.
- In the event that there are significant populations of RTE advice is sought on their management.
- The Non planted areas including native bush integral or adjacent to the FMU are not disturbed during harvest (NB the protection of bush is mandatory in WA and any clearing e.g. for safety etc. is heavily regulated).

HCV 2. Forest areas containing large landscape level forests, contained within, or containing the management unit, where viable populations of most, if not all, naturally occurring species exist in natural patterns of distribution and abundance.

In general these are small plantations in and around farmed land. There are no large landscape level forest considerations these FMU.

HCV 3 Forest areas that are in or contain rare, threatened or endangered ecosystems.

The same actions as for HCV 1:

- The owner is asked if they know of any known sites with RTE ecosystems.
- Non planted areas are shown on a site map.
Publicly available maps and overlays are interrogated for the presence of RTE ecosystems.
In the event that there are significant RTE ecosystems advice is sought on their management.
The Non planted areas including native bush integral or adjacent to the FMU are not disturbed during harvest (NB the protection of bush is mandatory in WA and any clearing e.g. for safety etc is heavily regulated).

HCV 4. Forest areas that provide basic services of nature in critical situations such as slope, erosion control, water catchment.

Although not mandatory in WA the state code of practice for timber production is followed.  

There is an on-site analysis pre harvest to identify issue, this leads to control measures e.g.:

- Riparian zones are excluded from disturbance during harvest.
- Creek lines are kept free of activity or debris.
- For erosion control roading is maintained and drainage is maintained.
- Stream crossing is only at designated points.
- In wet periods there is no harvesting in heavy or steep land.

HCV 5. Forest areas fundamental to meeting basic needs of local communities (water, food, firewood, shelter, income) with no readily available alternative.

NOTE: These are not applicable in this situation i.e., This is private land, no one relies on these forests for fire wood or shelter.

HCV 6. Forest areas critical to local communities’ traditional cultural identity (areas of cultural, ecological, economic or religious significance identified in cooperation with such local communities)

The owner declares any known sites heritage sites.
Publically available maps and overlays are interrogated for the presence of Heritage sites e.g.
For post Colonial heritage sites. If the land has been recently established then a record of shire approval should also show a cultural heritage check.
If sites or artifacts are found during activities the appropriate authority is alerted and their instructions followed.(Note this is mandatory in WA for Aboriginal sites).

**Controlled Wood Category 4 – Wood from Forests being converted to plantations or non-forest use**

Wespine will make our own assessment during operational visits, noting the extremely low risk found in the National Risk Assessment.

5.3. Barker Timber Group

General

The controlled materials are sourced predominantly from privately owned land (Sharefarms). The plantation up to the point of harvest is managed by the Forestry Products Commission (FPC). Barker Timber Group have a contract that allows them to harvest and sell products from specified share farms in the “Mid West” area.

FPC produce an FPC47 which covers:
- Tenure
- Biological Diversity
- Productive Capacity
- Health and Vitality
- Soil Conservation
- Water
- Socio economic

Operations on private land go through a similar process and produce an FPC47.

The key aspects of the FPC47 that are within the control or influence of the FPC area officer in charge and the contractors reporting to the FPC are communicated at the commencement of an operation via an FPC377.

The 377 distils key operational controls, and includes maps showing rare threatened and endangered species in the locality, areas of significance for First Nations and water values that could be negatively affected by poor performance. It also includes details of stakeholders within the local area, and details what communication has been made to local residents (for example).

Once an operation has commenced, the day to day supervision of the performance against the 377 is monitored using a FPC106. This is now an electronic document, and automatically backs up to a central collector server, allowing full visibility that operational checks are being performed.

Further, it tracks escalations that occur when a transgression has been detected or observed. This escalated activity is known as an FPC080, and includes specific, time bound, follow up actions and inspections that must be closed out. Again, this is a visible process.

Controlled Wood Category 3 – High Conservation Values

HCV 1. Forest areas containing habitat for national or state-listed threatened species or species of high significance.

See “FPC” above.

HCV 2. Forest areas containing large landscape level forests, contained within, or containing the management unit, where viable populations of most, if not all, naturally occurring species exist in natural patterns of distribution and abundance.
See “FPC” above.

HCV 3 Forest areas that are in or contain rare, threatened or endangered ecosystems.

See “FPC” above.

HCV 4. Forest areas that provide basic services of nature in critical situations such as slope, erosion control, water catchment.

See “FPC” above.

HCV 5. Forest areas fundamental to meeting basic needs of local communities (water, food, firewood, shelter, income) with no readily available alternative.

See “FPC” above.

HCV 6. Forest areas critical to local communities’ traditional cultural identity (areas of cultural, ecological, economic or religious significance identified in cooperation with such local communities)

See “FPC” above.

*Controlled Wood Category 4 – Wood from Forests being converted to plantations or non-forest use*

Wespine will make our own assessment during operational visits, noting the extremely low risk found in the National Risk Assessment.
5.4. Saddleback Tree Farms

General

The controlled materials are sourced from *Pinus* *spp* mainly *P radiata* from private plantations.

If plantations have been established shire approval is needed for the establishment.

Publicly available information is interrogated to determine the presence or absence of HCV e.g. 

A property interest report is also interrogated periodically
[https://www0.landgate.wa.gov.au/property-reports/single-address-report/property-interest-reports](https://www0.landgate.wa.gov.au/property-reports/single-address-report/property-interest-reports)

Any findings of HCV are recorded on maps and form part of the harvest plans.

Controlled Wood Category 3 – High Conservation Values

HCV 1. Forest areas containing habitat for national or state-listed threatened species or species of high significance.

There are several controls in place to determine species of high significance, and to protect habitat.

- Non planted areas are shown on a site map.
- Publically available maps and overlays are interrogated for the presence of RTE species.
- The Non planted areas including native bush integral or adjacent to the FMU are not disturbed during harvest

HCV 2. Forest areas containing large landscape level forests, contained within, or containing the management unit, where viable populations of most, if not all, naturally occurring species exist in natural patterns of distribution and abundance.

There are no large landscape level forest considerations these FMU.

HCV 3 Forest areas that are in or contain rare, threatened or endangered ecosystems.

The same actions as for HCV 1:

HCV 4. Forest areas that provide basic services of nature in critical situations such as slope, erosion control, water catchment.

Although not mandatory in WA the state code of practice for timber production is followed. 

There is an on-site analysis pre harvest to identify issue, this leads to control measures e.g.:
• Riparian zones are excluded from disturbance during harvest.
• Creek lines are kept free of activity or debris.
• For erosion control roading is maintained and drainage is maintained.
• Stream crossing is only at designated points.
• In wet periods there is no harvesting in heavy or steep land.

HCV 5. Forest areas fundamental to meeting basic needs of local communities (water, food, firewood, shelter, income) with no readily available alternative.

NOTE: These are not applicable in this situation i.e., This is private land, no one relies on these forests for fire wood or shelter.

HCV 6. Forest areas critical to local communities’ traditional cultural identity (areas of cultural, ecological, economic or religious significance identified in cooperation with such local communities)

If the land has been recently established then a record of shire approval should also show a cultural heritage check.

If sites or artifacts are found during activities the appropriate authority is alerted and their instructions followed. (Note this is mandatory in WA for Aboriginal sites).

**Controlled Wood Category 4 – Wood from Forests being converted to plantations or non-forest use**

Wespine will make our own assessment during operational visits, noting the extremely low risk found in the National Risk Assessment.
5.5. Other Private Wood Suppliers

General

The controlled materials are sourced from Pinus spp mainly *P radiata*.

Wespine audits include these Forest management Units (FMUs) in every annual verification audit.

**Controlled Wood Category 3 – High Conservation Values**

5.5.1. Assessment of the HCV control system

Publicly available information is interrogated to determine the presence or absence of HCV e.g. http://naturemap.dec.wa.gov.au/default.aspx

Any findings of HCV are recorded on maps and form part of the harvest plans.

**HCV 1. Forest areas containing habitat for national or state-listed threatened species or species of high significance.**

In general these are small plantations in and around farmed land with little or no native bush or habitat areas so the presence of Rare Threatened or Endangered (RTE) is unlikely. However there following steps are taken:

- The owner is asked if they know of any known sites with RTE species.
- Non planted areas are shown on a site map.
- Publicly available maps and overlays are interrogated for the presence of RTE species.
- In the event that there are significant populations of RTE advice is sought on their management.
- The Non planted areas including native bush integral or adjacent to the FMU are not disturbed during harvest (NB the protection of bush is mandatory in WA and any clearing e.g. for safety etc. is heavily regulated).

**HCV 2. Forest areas containing large landscape level forests, contained within, or containing the management unit, where viable populations of most, if not all, naturally occurring species exist in natural patterns of distribution and abundance.**

In general these are small plantations in and around farmed land. There are no large landscape level forest considerations in these FMUs.

**HCV 3 Forest areas that are in or contain rare, threatened or endangered ecosystems.**

The same actions as for HCV 1:

- The owner is asked if they know of any known sites with RTE ecosystems.
- Non planted areas are shown on a site map.
- Publicly available maps and overlays are interrogated for the presence of RTE ecosystems.
In the event that there are significant RTE ecosystems advice is sought on their management.

The Non planted areas including native bush integral or adjacent to the FMU are not disturbed during harvest (NB the protection of bush is mandatory in WA and any clearing e.g. for safety etc is heavily regulated).

**HCV 4. Forest areas that provide basic services of nature in critical situations such as slope, erosion control, water catchment.**

Control measures include:

- Riparian zones are excluded from disturbance during harvest.
- Creek lines are kept free of activity or debris.
- For erosion control roading is maintained and drainage is maintained.
- Stream crossing is only at designated points.
- In wet periods there is no harvesting in heavy or steep land.

**HCV 5. Forest areas fundamental to meeting basic needs of local communities (water, food, firewood, shelter, income) with no readily available alternative.**

NOTE: These are not applicable in this situation i.e. This is private land, no one relies on these forests for fire wood or shelter.

**HCV 6. Forest areas critical to local communities’ traditional cultural identity (areas of cultural, ecological, economic or religious significance identified in cooperation with such local communities)**

The owner declares any known sites heritage sites. Publically available maps and overlays are interrogated for the presence of Heritage sites e.g. For Aboriginal Cultural Heritage. http://www.dia.wa.gov.au/AHIS/default.aspx

If the land has been recently established then a record of shire approval should also show a cultural heritage check. For post Colonial heritage sites. http://stateheritage.wa.gov.au/state-heritage-register/about-the-state-heritage-register/heritage-places-database

If sites or artifacts are found during activities the appropriate authority is alerted and their instructions followed. (Note this is mandatory in WA for Aboriginal sites).

There is also cultural heritage training on observation and recognition of cultural heritage and dealing with cultural heritage issues is covered in the Timber harvesting manual.

If sites or artifacts are found during activities the appropriate authority (DIA) is alerted and their instructions followed. (Note this is mandatory in WA for Aboriginal sites). DIA are responsible for informing the South West land and Sea Council in such cases.
Controlled Wood Category 4 – Wood from Forests being converted to plantations or non-forest use

Wespine will make our own assessment during operational visits, noting the extremely low risk found in the National Risk Assessment.
6. Monitoring the Control Measures

For all suppliers including private growers detailed records are kept of supplying blocks and these are made available to FSC auditors. Wespine has established specific procedures for the gathering of information from suppliers concerning the source of fibre to be supplied.

The Stock Control Coordinator has the responsibility for sourcing the following information from fibre suppliers:

<table>

Wespine ensures the implementation of the control measures by engaging a qualified Forest Practices Officer.

The Forest Practices Officers duties include:
- Conducting field assessments of forest operations in support of Wespine’s certification systems.
- Preparing assessment reports for filing.
- Liaising with Wespine’s suppliers’ field staff.
- Providing input into development and improvement of assessment processes.

Visits to suppliers harvest blocks are all used as audits of control measures using form CoC & FSC CoC-07-01 Forest Operation Inspection.docx

There is a specific record of these visits kept by Wespine as evidence of the monitoring of these control measures.

Wespine has established an annual target for the number of forest visits to be undertaken by either the Forest Practices Officer, or the Resource Manager.

<table>
<thead>

Wespine is a party to an industry wide HCV “user group”, and we use the experiences of others to inform us about the need for more in-depth or more regular assessment of HCV control measures.

Wespine also consults with recognised experts in due diligence systems. Presently, this expert is Mr. Kevin O’Grady of Pinnacle Consulting. Mr. O’Grady is contacted annually for his assessment on the sufficiency of our due diligence measures, and the relative risk in Western Australia of sourcing wood from unacceptable sources.

We will also respond to stakeholder feedback and views. When evidence exists that HCV’s are not being adequately addressed, then we will revise our position, and consider more frequent site assessments.
### 7. Mixing Risk Assessment

<table>
<thead>
<tr>
<th>Step</th>
<th>Hazard Identification</th>
<th>Risk Evaluation and Justification</th>
<th>Control Measure</th>
</tr>
</thead>
<tbody>
<tr>
<td><strong>Harvest</strong></td>
<td>Taking wood from blocks that are not covered under the Due Diligence system</td>
<td><strong>Negligible risk</strong>&lt;br&gt;Only contracted wood is taken. All contracted wood from all suppliers are covered under the Due diligence system</td>
<td>The delivery note system ensures that wood is fully traceable to a coup of origin and that these coups are covered by the DDS. Full details of the traceability system are included in the document. DOCUMENT NO: COC-01 Wespine INDUSTRIES PTY LTD Chain of Custody Procedure. Suppliers must provide &quot;FPC 709&quot; or Harvesting operation notification sheets prior to new operations commencing. The desired outcome is that no new operations commence without Wespine’s knowledge, and that full opportunity exists to inspect operations, if so desired.</td>
</tr>
<tr>
<td><strong>Wood from outside the risk assessed area</strong></td>
<td>Only supply from Central forest district due to economic truck radius.</td>
<td></td>
<td>The delivery note system ensures that wood is fully traceable to a coup of origin and that these coups are covered by the DDS. The desired outcome is that all deliveries are identified back to source and the risk of mixing becomes negligible.</td>
</tr>
<tr>
<td><strong>All of W Australia has the same risk</strong></td>
<td></td>
<td></td>
<td></td>
</tr>
<tr>
<td>Receipt, processing and storage at different chipping sites and transport of chip to the organisations chip pile/point of sale at the Port of Bunbury</td>
<td>Receipt, processing and storage at different chipping sites and transport of chip to the organisations chip pile at the Port of Bunbury. Taking of wood from blocks that are not covered under the Due Diligence system</td>
<td>Only contracted wood is processed, stored and transported to the Port of Bunbury. All contracted wood from all suppliers are covered under the Due diligence system. <strong>Negligible risk</strong></td>
<td>The Inventory, stock control system and transport delivery note system ensures that wood is fully traceable to wood covered by the DDS at all stages. Suppliers have mechanisms in place to manage inventory, WAPRES Diamond Mill is FSC CoC and PEFC CoC certified. <strong>Negligible risk</strong>. The desired outcome is to select outsourced suppliers with demonstrated capability and experience in materials handling and storage so that the risk of mixing becomes negligible. The computerized receival system only allows loads of logs or chips covered by a delivery note from a coupe that is traceable and covered by this DDS. The desired outcome is no loads are delivered from operations which have not been entered into the database prior.</td>
</tr>
</tbody>
</table>

| In the wood chip pile | **Negligible risk** Only supply covered by the traceability system is allowed entry to the storage areas. | The computerized receival system only allows loads of logs or chips covered by a delivery note from a coupe that is traceable and covered by this DDS. **Negligible risk**. The desired outcome is no loads are delivered from operations which have not been entered into the database prior. |
8. Stakeholder Consultation

This procedure is used for stakeholder consultations and instances when comments or complaints from Stakeholders. Formal stakeholder consultations will take place when the DDS is first set up and after that only whenever a risk designation of control measure changes. Comments and complaints may occur at any time.

1. Stakeholder identification: Wespine identified affected and interested stakeholders in relation to the forest management activities of their suppliers and the identified risk, including the stakeholder groups listed below. Forest Products Commission, and Australian Forestry Services consult routinely with neighbours, on HCV protections mentioned in the DDS. Wespine will identify and consult directly for operations on small private plantations it plans.

2. Consultation with directly affected stakeholders for small private plantations will occur for each private plantation harvested. Consultation will occur by direct contact, phone or email. Private plantation owners will be asked to complete the “Wespine Industries Pty Ltd FSC Controlled Wood Owner/Agent Declaration” and supplier operation details forms.

3. Stakeholder notification: Identified stakeholders will be invited to participate in the consultation at least six (6) weeks prior to the change to the DDS or related control measures that is the subject of the consultation. Wespine shall employ effective means to inform stakeholders, using culturally appropriate consultation techniques. FSC Australia will be involved in the consultation both as a stakeholder and as a conduit to invite stakeholder comments via the FSC Australia web page.

4. Stakeholder engagement techniques. Techniques to contact stakeholders may include face to face meetings, personal contacts by phone, email, or letter, notice published in the national and/or local press and on relevant websites (e.g. FSC Australia), local radio announcements, or local customary notice boards and bullroarers.

5. Stakeholder consultation. All identified stakeholders are provided access to information that is relevant to the consulted issue no later than six (6) weeks prior to the change to the DDS that is the subject of the consultation. Wespine only excludes information that is considered confidential. In such cases a justification for the confidential nature of the information is presented to the FSC certification.

If there is a requirement to publish the comments stakeholders will be asked to provide their consent to the publication of their comments.

6. Stakeholder feedback. Within sixty (60) days after the end of the consultation period, Wespine will respond to all stakeholders who participated in the consultation process, to explain how their comments were taken into account.
8.1. Consultation records

Wespine maintains records of the consultation process, including a list of stakeholders consulted and their comments, and evidence that the consultation was carried out in line with the requirements of this standard.

8.2. Content of the report

Wespine will prepare a report of the consultation process, which includes:

a) The areas for which the stakeholder consultation has been conducted (e.g. geo-reference data, state, province, supply unit);

b) A list of the stakeholder groups invited by Wespine to participate in the consultation;

c) A summary of the stakeholder comments received. These will not normally be published but if they are comments are only be published with prior consent from the consulted stakeholder and not associated with stakeholder names;

d) A description of how Wespine has taken stakeholder comments into account;

e) The organization's justification for concluding that the material sourced from these areas can be used as controlled material or sold with the FSC Controlled Wood claim of the certification process, according to Section 6 of the controlled wood standard.

8.3. Stakeholders groups

Groups or individuals representing the interests listed below, that are relevant and according to identified risk, will be identified and added to a stakeholder database and notified during the consultation process. Each group specified may be represented by an unlimited number of representatives, subject to balanced consideration of the input received during the consultation. The list is not comprehensive and any other stakeholder groups relevant to the certification process may be identified, added to the stakeholder database and notified.

Economic interests:

a) Forest owners and/or managers of large, medium and small forests, and high, medium, and low-intensity managed forests;

b) Forest contractors (including loggers);

c) Representatives of forest workers and forest industries;

d) Certificate holders

e) Social interests

f) NGOs involved or with an interest in social aspects of forest management and other related operations;

g) Forest workers;

h) International, national and local trade/labour unions;

i) Representatives of local communities involved or with an interest in forest management, including those relevant for HCVs 5 and 6;

j) Representatives of Indigenous Peoples and/or traditional peoples (if present and/or holding rights), including those relevant for HCVs 5 and 6;

k) Representatives of recreational interests

l) FSC-accredited certification bodies active in Australia,

m) experts,

o) research institutions and universities or FSC regional offices,
p) Other directly affected local stakeholders.

**Environmental interests**

a) NGOs involved or with an interest in the environmental aspects of forest management. Consultation should target the following areas of interest and expertise:
   - Biological diversity
   - Water and soil
   - HCVs 1-4

b) Local communities and Indigenous Peoples’ representatives (HCVs 5 and 6).

**FSC-accredited certification bodies active in the country**

- National and state forest agencies
- Experts with expertise in controlled wood categories
- Research institutions and universities
- FSC Australia

### 8.4. Stakeholder complaints about the DDS.

All complaints are dealt with by a common procedure which is documented in Chain of Custody and Controlled Wood Procedure APPENDIX 1 – Wespine DISPUTE AND ISSUE RESOLUTION PROCEDURE. A copy of this procedure is available on request.

Contact information of the person or position responsible for addressing Complaints:

Resource Manager  
Wespine Industries Pty Ltd  
0427 0800 75

### 9. Auditor training

Wespine personnel conducting field verification audits have had appropriate training on the concept of High Conservation Values against the requirements of the FSC Australia HCV framework.

### 10. Internal Audit of the DDS

The Wespine DDS is internally audited at least annually to ensure that it is being implemented correctly. The scope, dates, and staff involved in internal are recorded on the records of internal audits. Where the DDS is evaluated as ineffective during the internal audit all relevant issues are addressed and corrected within 12 months of their detection.
